Creating *The Rest of Your Pages* *for Your* Ishigame Travel, Inc. Site

Introduction

Whether you created Design A or Design B, you have already designed the remaining pages for your site, and Part B of this assignment is to create them; bring them to life as web pages.

A Review of the Steps for Turning the Designs into Pages

1.   You should have already designed the pages for the rest of your site (Step 1)
2.   You should have already exported the images for the rest of your site (Step 2)
3.   Now you need to determine the table structure for your web site (Step 3)
4.   Assemble your pages in HTML or Dreamweaver (Step 4)

Determining the table structure will be the most difficult part - because the table structure will determine whether or not the finished page actually looks like the design you put together in Fireworks®.

Once you have your table structure, adding the images (assembling the pages) is the easy, and fun part.

In the next lesson, you will be given instructions for linking the pages together. For now, just concentrate on getting the pages created.

Basic Structure Set Up - That s the Goal for This Assignment

As you start to make the basic design for your pages, you may be tempted to put all content on your pages. Refrain for now. This step is where students tend to jump ahead, attempting to add all content to the pages. But those instructions are coming up in another lesson. For now, concentrate on getting the basic structure set up:
1.   Site navigation
2.   Page Heading
3.   Image(s) that are constant on all pages

Once you get that much done on a page, save the page. Then change the page heading and click **File, Save As...** Then save the page with a name that is consistent with the page heading. Repeat until you have a page created for every link within the site navigation. That s the goal of this assignment - to get the basic structure set up for your pages   hold off on adding the content just yet. That step is coming up.
